

**METHOD AND SYSTEM FOR INITIATING EXECUTION OF SOFTWARE
IN RESPONSE TO A STATE**

Abstract of the Disclosure

According to a first embodiment, a first computing device selectively initiates execution of a software application by one of: (a) the first computing device if a state of at least one of the first computing device and a second computing device is a first state; and (b) the second
5 computing device if the state is a second state. The software application is associable with one or more software objects.

According to a second embodiment, a first computing device executes a software application that is associated with at least one software object. In response to a request for initiating execution of the software object, the first computing device selectively initiates
10 execution of the software object by one of: (a) the first computing device if a state of at least one of the first computing device and a second computing device is a first state; and (b) the second computing device if the state is a second state. The first computing device performs such operation independent of the software application.
